Displaying PDF in React app

Sagar Shrestha

Jun 5 · 2 min read ★

I want to show you an easy and simple way to display PDF files using React in the browser. I will be using a library called `react-pdf`. This library is capable of rendering PDF files given an URL or a local file inside the project or base64 encoded version.

To get started, create a simple React application using Create React App. To do this you can run the following commands:

```
npx create-react-app display-pdf-app  
cd display-pdf-app  
npm start
```

After this, add the `react-pdf` library to the project using the following command:

```
npm install --save react-pdf
```

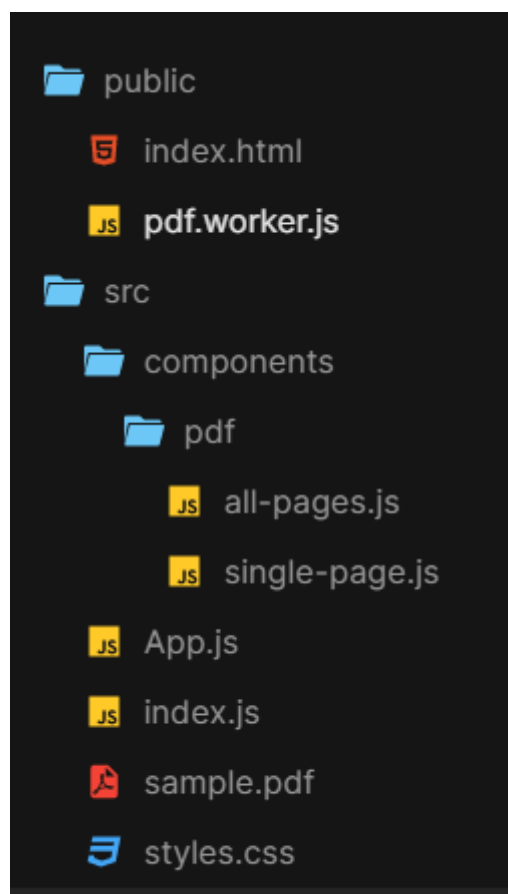

To render the PDF file, `react-pdf` has a `Document` component where you need to pass a `file` prop. Then inside the `Document` component, you need to create a `Page` component. Simple isn't it? Sample code:

```
import React from 'react';
import { Document, Page } from 'react-pdf';

import samplePDF from './test.pdf';

export default function Test() {
  return (
    <Document file={samplePDF}>
      <Page pageNumber={1} />
    </Document>
  );
}
```

The final project structure will look like this:

Let's start with creating `single-page.js` and `all-pages.js` inside the `components - pdf` folder with the following contents:

- `single-page.js`

```
1  import React, { useState } from "react";
2  import { Document, Page } from "react-pdf";
3
4  export default function SinglePage(props) {
5    const [numPages, setNumPages] = useState(null);
6    const [pageNumber, setPageNumber] = useState(1); //setting 1 to show first page
7
8    function onDocumentLoadSuccess({ numPages }) {
9      setNumPages(numPages);
10     setPageNumber(1);
11   }
12
13   function changePage(offset) {
14     setPageNumber(prevPageNumber => prevPageNumber + offset);
15   }
16
17   function previousPage() {
18     changePage(-1);
19   }
20
21   function nextPage() {
22     changePage(1);
23   }
24
25   const { pdf } = props;
26
27   return (
28     <>
29       <Document
30         file={pdf}
31         options={{ workerSrc: "/pdf.worker.js" }}
32         onLoadSuccess={onDocumentLoadSuccess}
33       >
34         <Page pageNumber={pageNumber} />
35       </Document>
36       <div>
37         <p>
38           Page {pageNumber || (numPages ? 1 : "--")} of {numPages || "--"}
39         </p>
40       </div>
41     </>
42   );
43 }
```

```
39     </p>
40     <button type="button" disabled={pageNumber <= 1} onClick={previousPage}>
41       Previous
42     </button>
43     <button
44       type="button"
45       disabled={pageNumber >= numPages}
46       onClick={nextPage}
47     >
48       Next
49     </button>
50   </div>
51 </>
52 );
53 }
```

single-page.js hosted with ❤️ by GitHub

[view raw](#)

- all-pages.js

```
1 import React, { useState } from "react";
2 import { Document, Page } from "react-pdf";
3
4 export default function AllPages(props) {
5   const [numPages, setNumPages] = useState(null);
6
7   function onDocumentLoadSuccess({ numPages }) {
8     setNumPages(numPages);
9   }
10
11   const { pdf } = props;
12
13   return (
14     <Document
15       file={pdf}
16       options={{ workerSrc: "/pdf.worker.js" }}
17       onLoadSuccess={onDocumentLoadSuccess}
18     >
19       {Array.from(new Array(numPages), (el, index) => (
20         <Page key={`page_${index + 1}`} pageNumber={index + 1} />
21       ))}
22     </Document>
23   );
24 }
```

[About](#) [Help](#) [Legal](#)

Get the Medium app

Now navigate to `App.js` and replace the content with the following code:

```
1  import React from "react";
2
3  import SinglePagePDFViewer from "../components/pdf/single-page";
4  import AllPagesPDFViewer from "../components/pdf/all-pages";
5
6  /* This is required only if the project file is located
7   inside the app. Otherwise you can use the external link of the pdf file*/
8  import samplePDF from "../sample.pdf";
9
10 import "../styles.css";
11
12 export default function App() {
13   return (
14     <div className="App">
15       <h4>Single Page</h4>
16       <SinglePagePDFViewer pdf={samplePDF} />
17
18       <hr />
19
20       <h4>All Pages</h4>
21       <div className="all-page-container">
22         <AllPagesPDFViewer pdf={samplePDF} />
23       </div>
24
25       <hr />
26     </div>
27   );
28 }
```

[view raw](#)

As you have noticed we have to create buttons to change the page of the document in `single-page.js` component. This is because `react-pdf` does not provide a user interface.

The full project code can be found [here](#) github and you can see the demo below:

App.js

```
1  import React from "react";
2
3  import SinglePagePDFViewer from "../components/p
4  import AllPagesPDFViewer from "../components/pdf
```

5

[Open Sandbox](#)

```
6  /* This is required only if the project file is  
7  inside the app. Otherwise you can use the exter
```

• • •

If you get the following error in console:

```
Uncaught SyntaxError: Unexpected token <
```

```
http://project_server.dev/app_folder/d58d9dd3a5c5f2a8eafb.worker.js
```

...

then follow the steps below:

1. Copy `node_modules/pdfjs-dist/build/pdf.worker.js` to `public/pdf.worker.js`
2. `options={{workerSrc: "pdf.worker.js"}}` Add this props inside the `Document` component from `react-pdf`. [It is already done in the above project.]
